# FOREWORD

I am pleased to distribute this publication listing primary forest industry manufactures in Alabama. Even with some of the recent mergers and mill closures, it is worth mentioning that Alabama is still a leader in forest products sales throughout the country and in the world. The forest industry is the backbone of Alabama. According to recent reports, the forestry sector in Alabama, consisting of more than 900 forestry-related manufacturing facilities, generate 18.3 percent of the state's total manufacturing output, generate \$11.1 billion in sales, and employ nearly 54,000 people! Combined with the state docks in Mobile, Alabama is well situated for both domestic and international trade.

The forest resources of Alabama are productive and growing. Alabama is home to the second largest commercial forest in the United States. As further presented in this publication, surveys continue to show that our forests are increasing in timber volume and biomass, while also providing valuable habitat for wildlife, places to recreate, and an invaluable filtration system that purifies our drinking water. Our forests produce 2½ times more timber volume now than fifty years ago. A majority of Alabama's commercial forestland is under certified stewardship programs to ensure the wise use and sustained management of our natural resources for future generations.

This publication presents general information on Alabama's forest resources and the primary manufacturing industry (a listing of secondary manufacturing industries will be published in the fall). The Alabama Forestry Commission maintains this and more detailed information on our website ([www.forestry.alabama.gov](http://www.forestry.alabama.gov)) under the "Forest Management", "Forest Statistics", and "Market Resources" sections. I urge you to either visit our web site or contact our economic development section by calling 334-240-9300 for further information or detailed analysis for your particular needs and area.

Thank you for participating in the primary forest industry survey. Having recently retired with thirty years service in the private sector with a large forest industry company, I believe this information is very useful in your daily business operations and in marketing your products in Alabama, the USA, and throughout the world.

Sincerely,

Linda S. Casey,  
Alabama State Forester

# ALABAMA PRIMARY FOREST INDUSTRY DIRECTORY

## (June 2007)

The forestry sector in Alabama, consisting of more than 900 primary and secondary forestry-related manufacturing facilities, generate 18.3 percent of the state's total manufacturing output, \$11.1 billion in sales, and employ nearly 54,000 people (Source: Census Bureau)! There are an additional 820 non-manufacturing businesses (consulting and logging companies) in the State. Harvested woody materials from Alabama's forests remain the second largest agriculture commodity produced in the State.

The Alabama Forestry Commission resurveyed all primary forest products industries (i.e., manufactures that purchase raw woody materials) during 2005 and 2006, and is currently in the process of resurveying all secondary forest products industries. This information is used to track the number, size, and type of manufacturers in the State. General information from these surveys is presented in this publication, as well as on our website ([www.forestry.alabama.gov](http://www.forestry.alabama.gov)), where it is available worldwide. The Forestry Commission believes this information is useful for marketing, trade, and investment decision-making.

Survey results indicate that there are 167 **primary** manufacturing facilities in the State. Of these, 98 are sawmills, 19 are plywood or veneer mills, and 14 are pulp and paper mills. These mills are identified on maps and listed by county in subsequent sections of this publication.

This publication also presents the current status of Alabama's forest resources, based on the latest survey information from the Forest Inventory Analysis data (Source: FIA Statistics). The Alabama Forestry Commission surveys continuous forest inventory plots under contract with the U.S. Forest Service, and completed the last five-year cycle, where all FIA plots were remeasured between 2000 and 2005.

Alabama contains the nation's second largest commercial forest, with 21.6 million acres. (Georgia has the largest commercial forested area on a statewide basis.)

Until 2000, there was a gradual increase of forestland acres in Alabama since 1953. However, between 2000 and 2005, there was a slight decrease of forestland, in part caused by the tremendous urban sprawl occurring nationwide. Between 2000 and 2005, Alabama experienced a loss of approximately 300,000 acres or 470 square miles (Source: FIA Statistics).

Approximately 95 percent of these forests are privately owned (5 percent owned by the public, primarily the National Forests). While there are many small land ownership tracts, the majority of the commercial forestland

**Percentage of Commercial Forestland by Ownership**

(tracts 100 acres or larger) is owned by farmers, individuals, partnerships and corporations who manage for multiple uses, with timber production, wildlife habitat, recreation, and environmental considerations being of foremost concern (Source: National Woodland Owner Survey).

Forest industry actually owns only 16 percent of the forestland in Alabama, though these are usually large tracts of land. Traditional forest industry companies have recently divested much of their remaining land holdings to institutional investors. (However, this ownership change is not yet reflected in the FIA data.) The results of these divestitures will play out over the next few years.

Even though acreage decreased during the last five years, Alabama still has more timber volume now than in 1953. Because of landowner's great commitment to sustainably manage their forests, the total volume of trees in Alabama is almost 2½ times what it was in 1953! The forests continued to grow and become more productive even with strong timber markets, in which the timber industry currently harvests two times more than it did in 1953 (Source: FIA Statistics).

Not only is the volume increasing, but the size and quality of Alabama's timber is much better. Currently, 70 percent of Alabama's forests contain significant pulpwood and sawtimber-sized timber.

Much of the pine volume increased as a result of the pine plantations planted in the 80's and 90's now becoming merchantable. Still, roughly two-thirds of the pine forests and most hardwood forests are from natural origins. Approximately half of the total growing stock consists of pine and the other half hardwood, as shown on the graphs on the following page.

**Area of Timberland by Stand Size**

## Alabama Total Growing Stock

By Species in Million Cubic Feet

## Alabama Sawtimber Growing Stock

By Species in Million Board Feet

Many people believe we are running out of trees and all our forests are being destroyed. This simply is NOT TRUE, at least in Alabama. Harvests are only a small percentage of the total inventory, and growth exceeds harvest, producing a net increase.

During the last inventory period (2000 to 2005), there were 13,460 million cubic feet of softwood and 14,839 million cubic feet (mmcf) of hardwood growing stock in Alabama.

Softwood and hardwood growth increased by 995 million cubic feet (+7.3%) and 517 million cubic feet (+3.5%), respectively. Softwood and hardwood removed through harvesting amounted to -827 million cubic feet (-6.1% of the total softwood inventory) and -394 million cubic feet (-2.7% of the total hardwood inventory). During the last five years, there was a net **increase** in forest volume inventory! (Source: FIA Statistics)

### **INVENTORY, GROWTH, AND HARVEST (2000 to 2005)**

	<b>INVENTORY (mmcf)</b>	<b>GROWTH (mmcf)</b>	<b>HARVEST (mmcf)</b>
<b>SOFT WOOD</b>	<b>13,460</b>	<b>+995 (+7.3%)</b>	<b>-827 (-6.1%)</b>
<b>HARD WOOD</b>	<b>14,839</b>	<b>+517 (+3.5%)</b>	<b>-394 (-2.7%)</b>

The recent trend for pine is different than what it was during the previous twenty years, i.e. from 1982 to 2000. During the previous period, pine harvests slightly exceeded growth. (The graph below shows the growth and drain for pine during the last fifty years.)

Two significant events occurred over the last twenty five years to cause this reversal. First, there was a significant improvement in the tree improvement genetics program. As a result, highly efficient and productive pine seedlings were produced and planted over thousands of acres. Government cost-share tree planting programs encourage private forestland owners to plant, and forest industry planted without government incentives in order to have a low-cost source of raw materials. These young pine seedlings and saplings planted over the last twenty five years recently moved into the pulpwood-sized category, which substantially increased the total woody volume.

Second, forest industry expanded quickly during the 80s and 90s and the forestry sector developed an overcapacity situation. Since the mid 90s, forest industry has reversed their overcapacity situation through consolidations and mill closures. While still the largest forest economy in the world (US companies generate 46% of total world forest product sales), the forest industry is once again becoming the most efficient and competitive, and with a tremendous forest resource base near most mills.

Hardwood growth has exceeded drain since 1980. However, as the graph below shows, the gap continues to narrow, as more hardwood is used in the manufacturing of high-quality paper products and other products. Additional intensive hardwood management will be needed to reverse this trend.

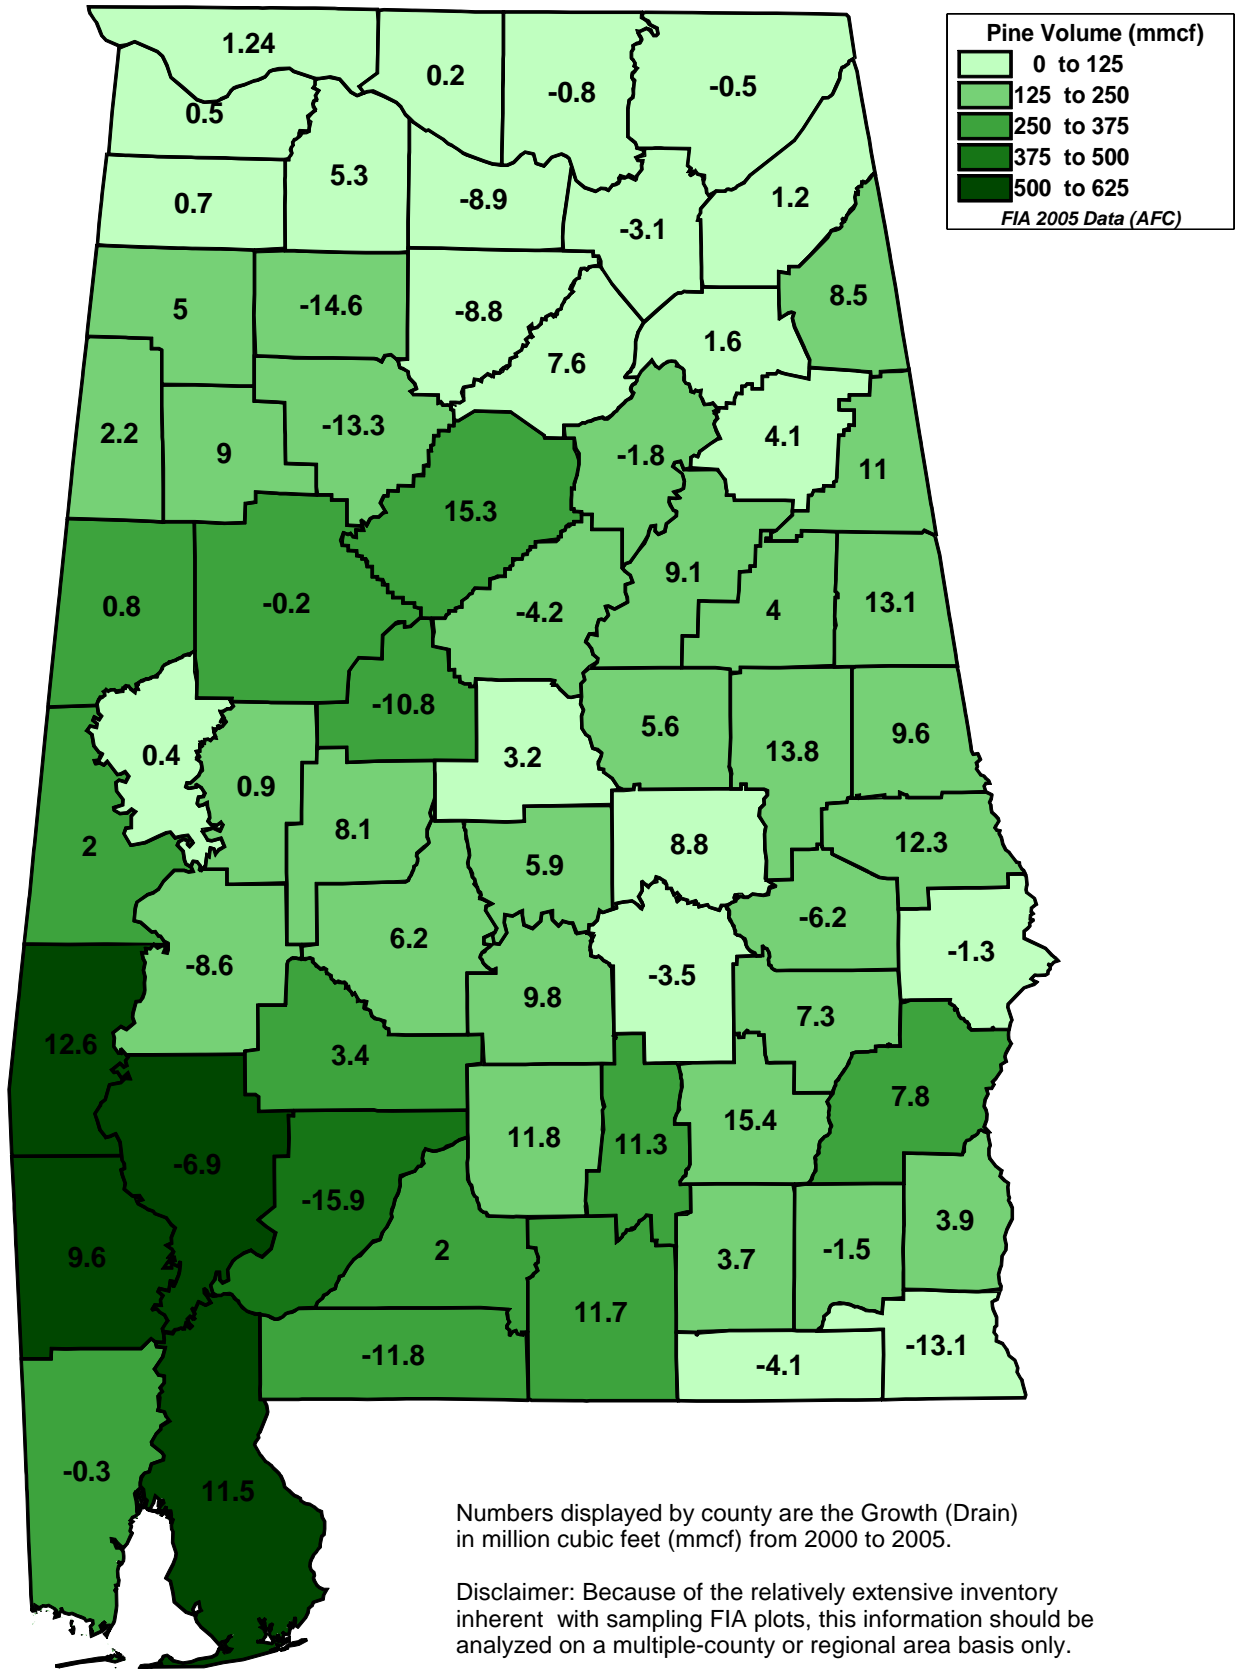

The maps on the following two pages show the general inventory volumes by county of the total growing stock for both softwood and hardwood. The darker green shading indicates greater volume in the county. (Source: FIA Statistics)

The number displayed for each county indicates the net increase of timber volume growing stock (if positive) or net decrease of timber volume growing stock (if negative) in million cubic feet for the county during the 2000-2005 period. Because of the relatively extensive inventory inherent with sampling FIA plots, this information should be analyzed on a multiple-county or regional area basis only. Many positive numbers over multiple counties in an area should indicate adequate forest growing stock. Many negative numbers over multiple counties in a regional area may reflect a situation where harvests exceeded growth over the five-year period. Resource managers and especially mill procurement managers should further analyze these situations, as it might indicate tightening wood supplies.

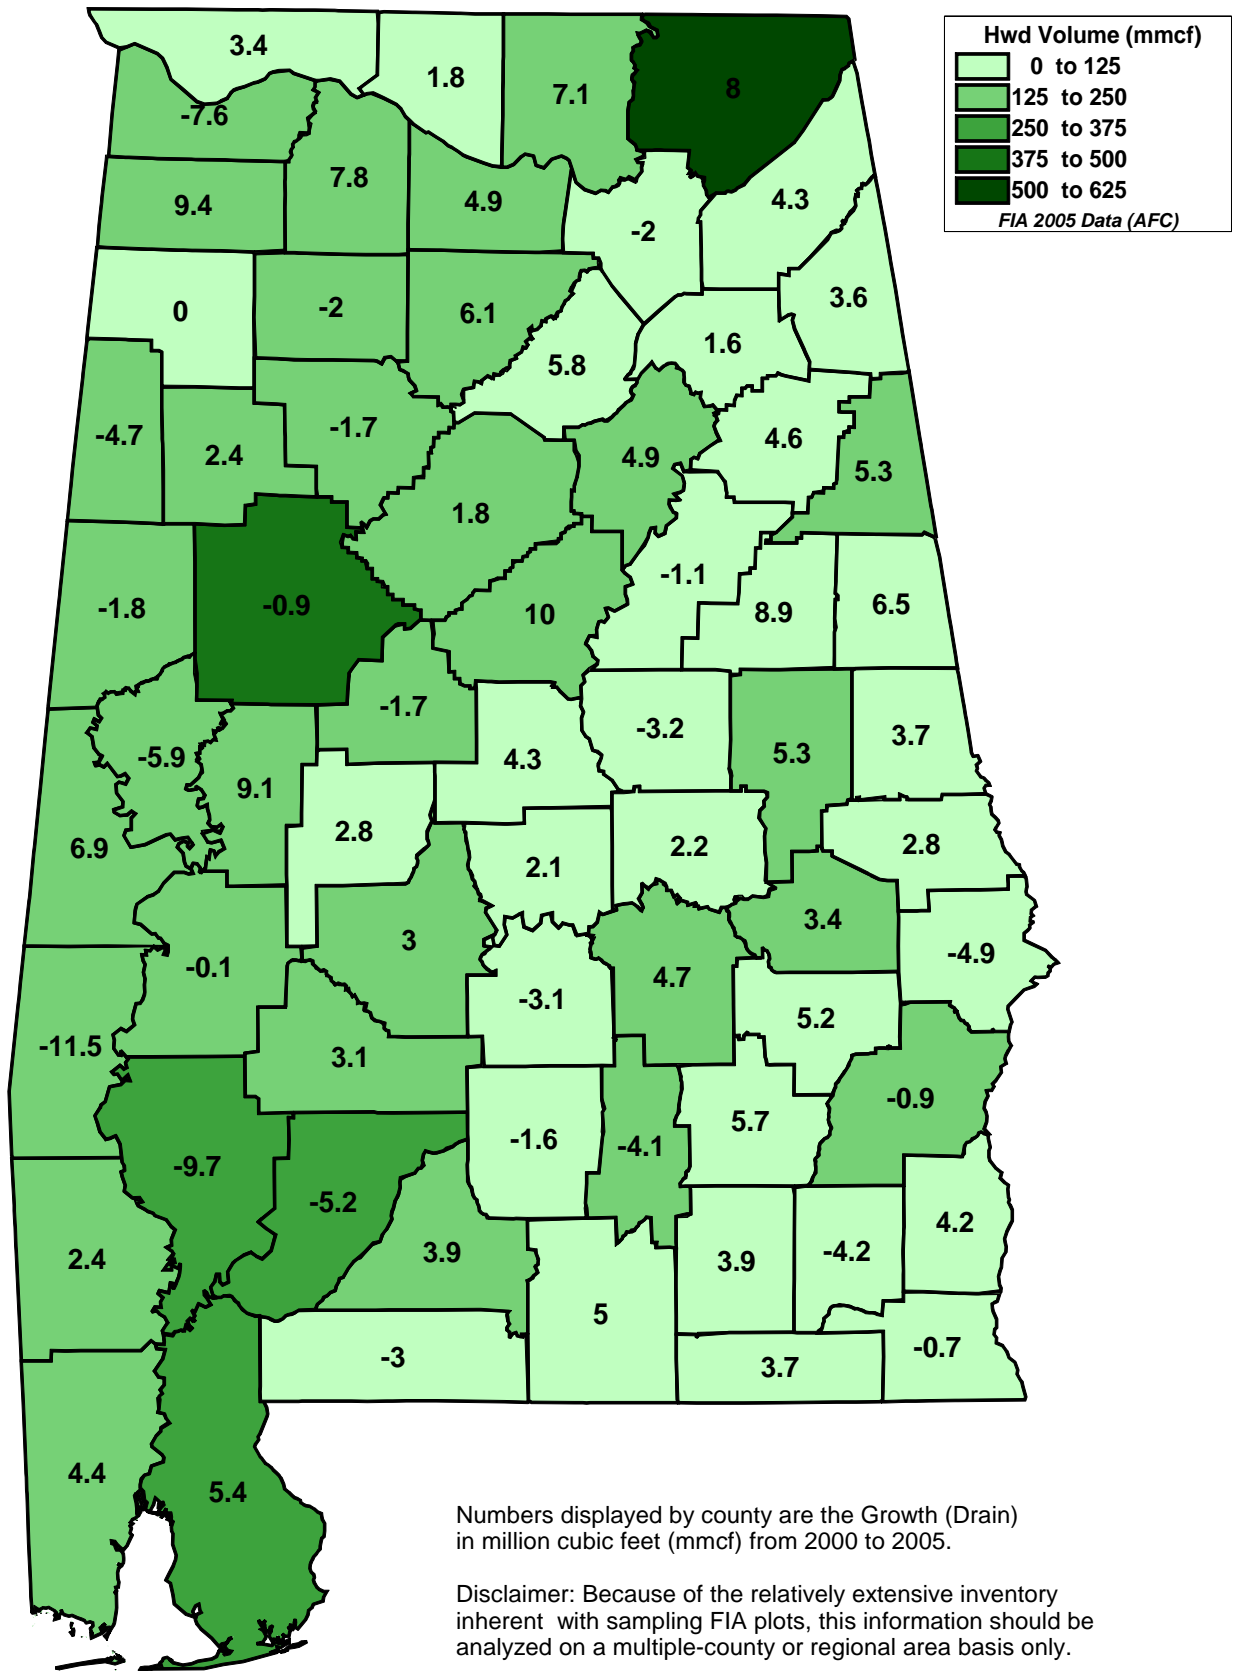

Following the timber volume growing stock maps are maps showing the locations of the primary forest industry product manufacturers, a listing of these manufacturers by county, and a general summary by county of volumes of raw woody material purchased by the primary manufactures.

*Disclaimer: Information for primary forest industries was obtained by surveying all known facilities that use raw woody material in their processing of final products. This survey was conducted during 2005 and 2006, with recently updated information for known ownership changes. The Alabama Forestry Commission has attempted to verify this information as much as possible, but cannot completely verify its complete accuracy.*
